Replication instructions for paper Absolute income mobility and the effect of parent generation inequality: An extended decomposition approach

We use full-population anonymized individual level data provided by Statistics Sweden and the University of Linköping. Access to the data is governed by Swedish data integrity laws and is therefore highly restricted.

More information on how to access Statistics Sweden's micro data is found *here*. Contact information is found below.

Instructions:

Do-files are sorted into three folders. Each do-file is numbered in the order in which they are to be run. DO-files in folder "Do Extract" retrieves the data from the SQL server and builds the data set. Do-files in folder "Do Estimate" estimates Absolute mobility and descriptive data for a various of different specifications. Do-files in folder "Do Tables and Graphs" produces the figures and tables used in the paper. In all three folders, Do-file number 0 enables one to run all Do-files in the folder without interruption.

To produce Figure 4, one should preferably download and prepare the data from Chetty et al (2017) to get US parent income distributions. Data and replication instructions for Chetty et al (2017) is found here. However, we provide all the data necessary to construct Figure 4 in the folder "Do Parent Dispersion Effect".
